BUSINESS ACTIVITY INDEX

BAI dynamics

* A value of the indicator above level 50 means a positive change, below level 50 - a negative. The further (higher or lower) the index value is from the 50 level, the higher the rate of change (increase or decrease) of the indicator.

According to the results of a monthly survey of 469 real sector enterprises in June 2022, business activity remained almost unchanged, amounting to **49.0** (in May – 48.9). In production, business activity deteriorated slightly: the index fell to **49.4** (in May – 50.8) due to a decrease in the volume of new orders and the level of employment.

In the mining industry and construction, where the index has risen (to **50.0** and **47.4**, respectively), there was an increase in the volume of new orders.

In the service sector, the indicator remained unchanged, amounting to **48.7**.

In all sectors, except the mining industry, the indicator was in the area of decline.

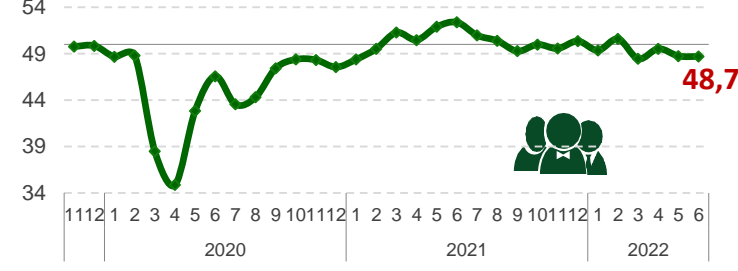

- The business activity index is a composite indicator that includes the aggregate of enterprises' answers to questions regarding the actual changes in the economic indicators of enterprises and the expectations regarding their changes in the future.
- The National Bank of Kazakhstan conducts a survey of enterprises participating in the monitoring of the real sector on a monthly basis

BUSINESS CLIMATE INDEX

Business cycle clock

Business climate assessment

Current and future business situation assessment, BA*

*Balance of answers (BA) is difference between positive and negative answers. Enterprises asked to assess the current business situation choosing one of the given answers «favorable», «unfavorable» and «neutral». Answers are weighted by respondents' size.

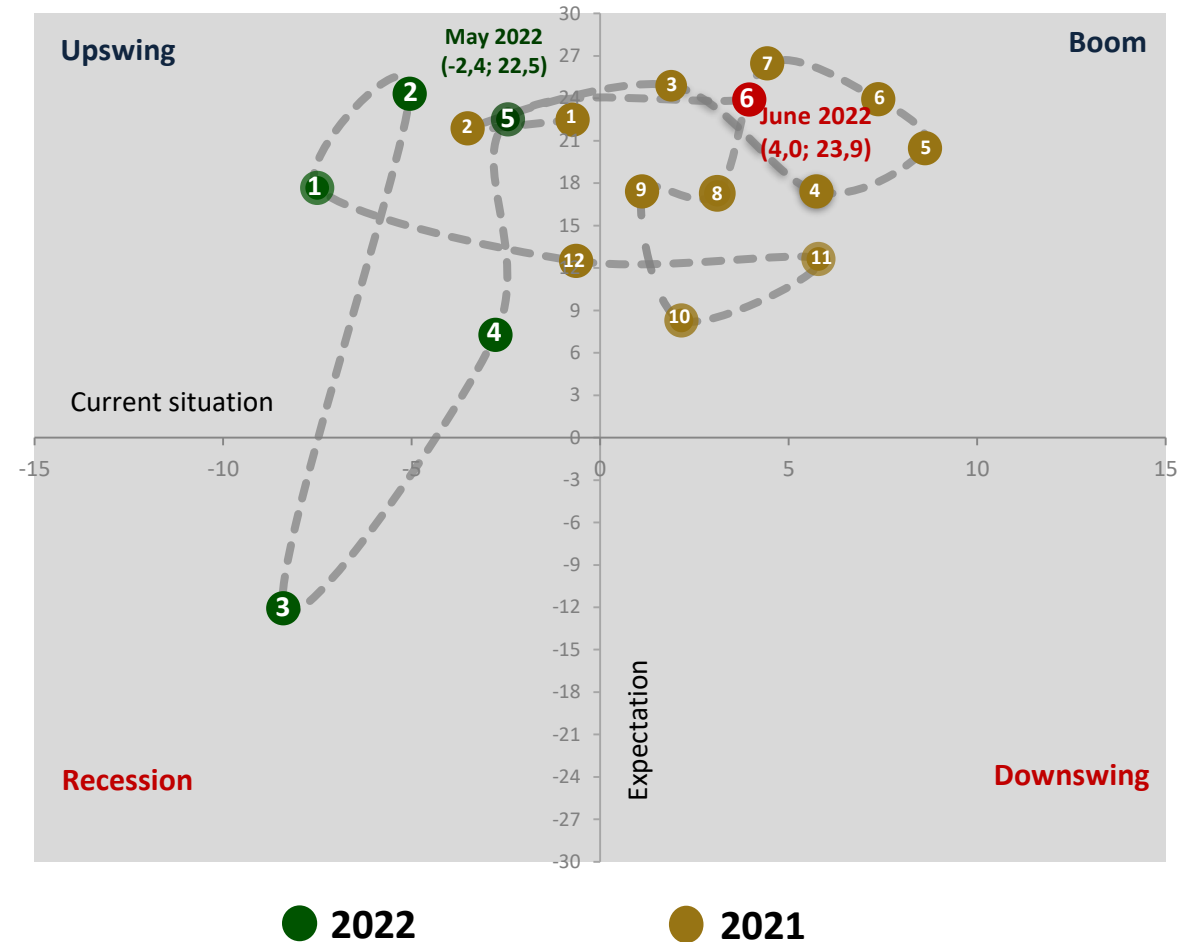

If index is above 0 improvement, if below 0 – worsening.

In June 2022, the assessment of enterprises of **current** business conditions improved to **4.0**. The balance of responses (BO)* turned out to be positive due to an increase in respondents who noted a positive change.

Estimates of **future** business conditions for the next 6 months also improved, amounting to **23.9**.

As a result, the business cycle "clock" indicator moved into the **boom** area in June.

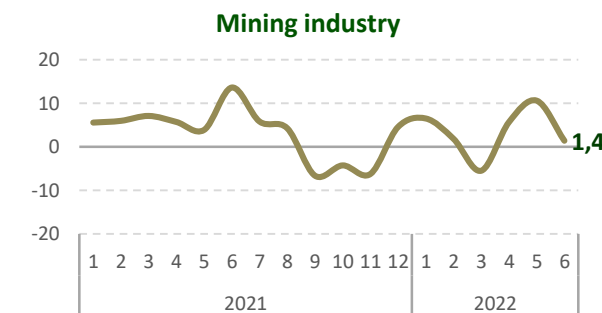

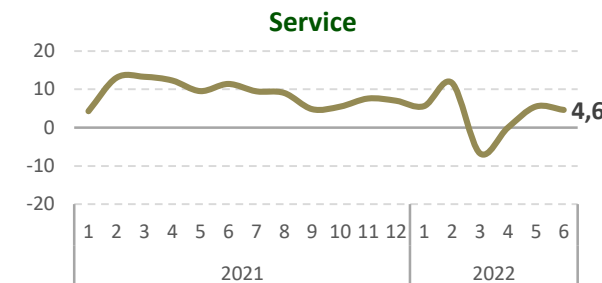

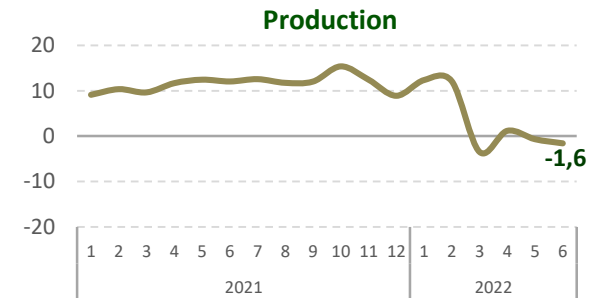

Business cycle clock

Business cycle clock is developed by Ifo institute demonstrates in which phase of the cycle the economy was in a certain period. To construct it the series of current conditions (X axis) and future conditions (Y axis) assessments are used.

Business climate index (BCI)

BCI* in economy

The **business climate index**, which is an average assessment of current and future business conditions, rose to **13.7** (from 9.5 in May), due to improved optimism about future business conditions, especially among construction companies.

The BCI in construction amounted to **23.4** (in May – 13.1). In other sectors, the indicator decreased, and in production it even turned out to be negative (**-1.6**), due to the deterioration of the assessment of the current situation. In the services and mining sectors, the index fell to **4.6** and **1.4** (from 5.5 and 10.6 in May, respectively).

*BCI is geometrical mean of current situation assessment and expectation

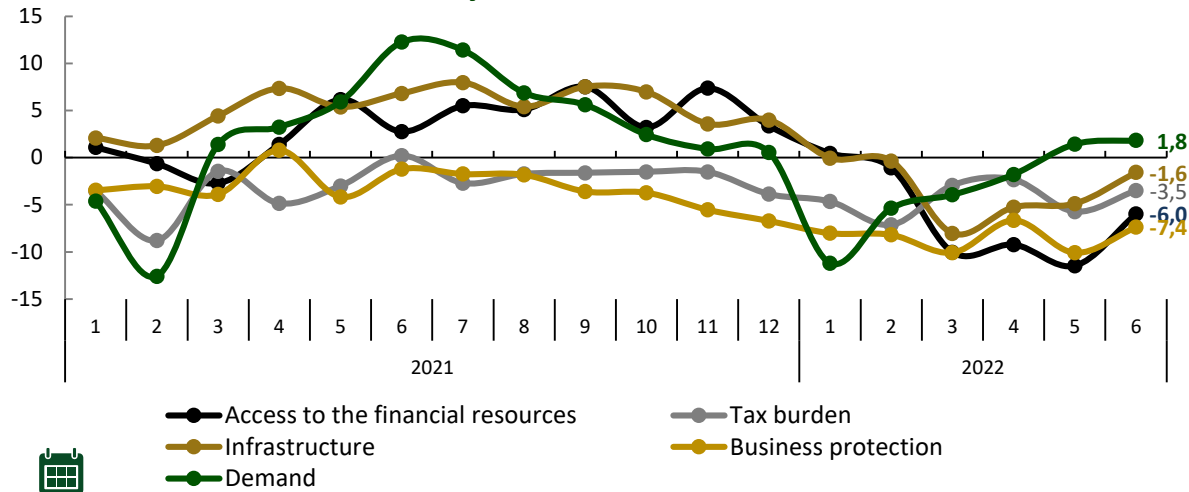

$$BCI^* = \sqrt{(BA(SIT) + 200) * (BA(EXP) + 200)} - 200$$

where, BA – balance of answers
 SIT – current economic condition
 EXP – expected economic condition

Assessment of factors influencing business climate

Dynamics of factors, BA*

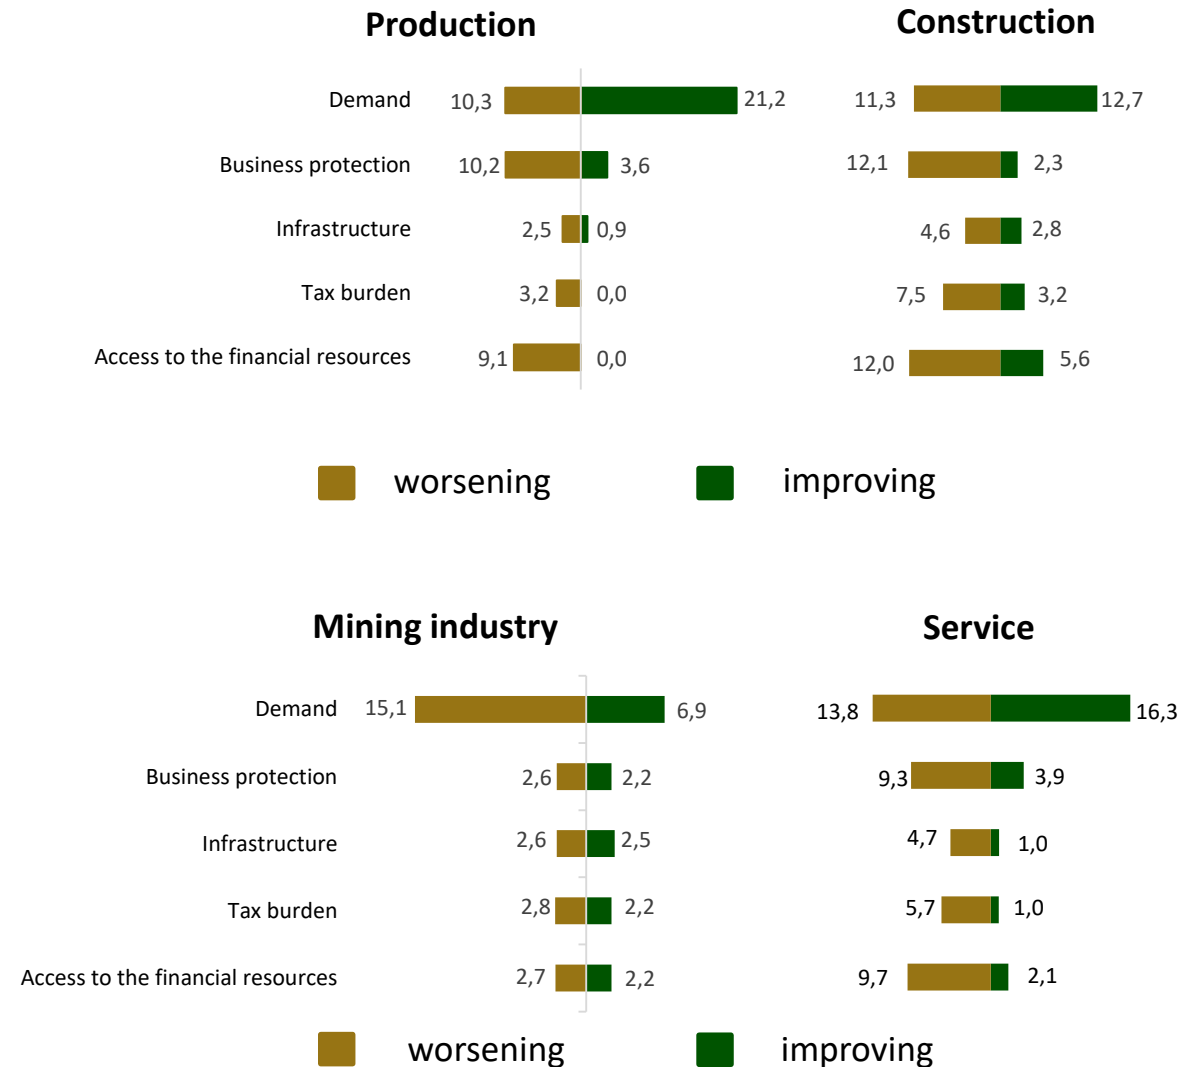

*Balance of answers (BA) is difference between positive and negative answers. If index is above 0 improvement, if below 0 – worsening.

In June 2022, negative responses prevailed among the assessments of business conditions factors. The improvement was noted only for demand. The balance of responses was **1.8**. For other factors (access to communications, access to finance/loans, business protection issues and tax burden), despite the predominance of negative assessments, there was a slight improvement.

By sector, respondents estimate that demand is recovering in production and services, where positive responses prevail. A decrease in demand was noted in the mining industry. Other factors, enterprises of all sectors, assessed more negatively than positively.

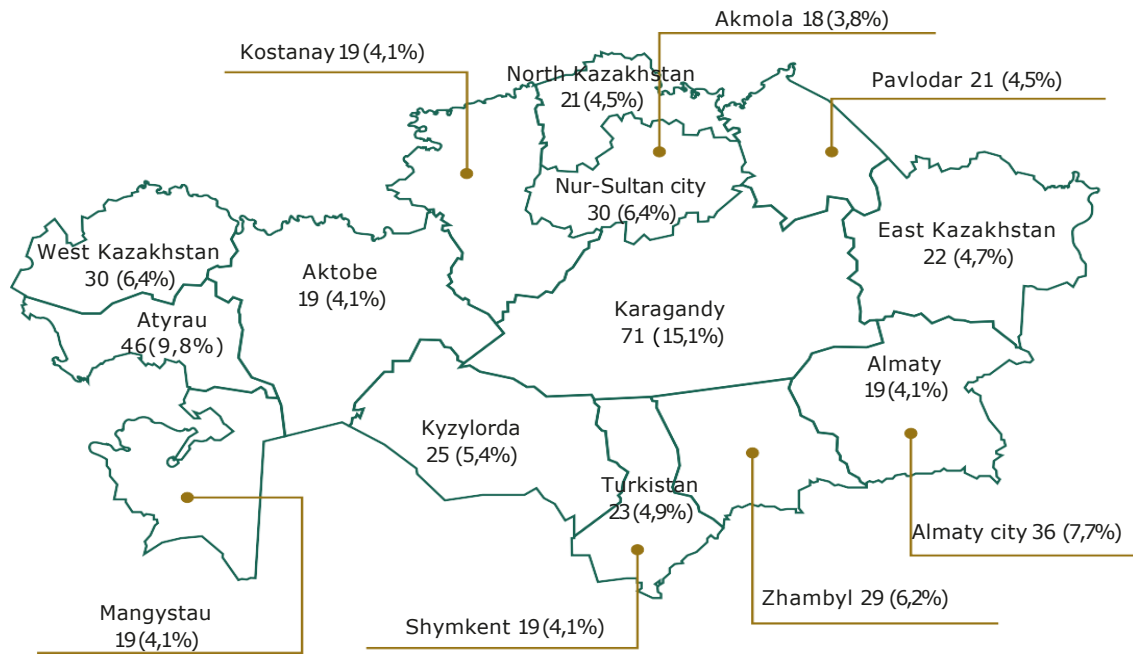

Assessment of factors in June 2022, share of answers in %

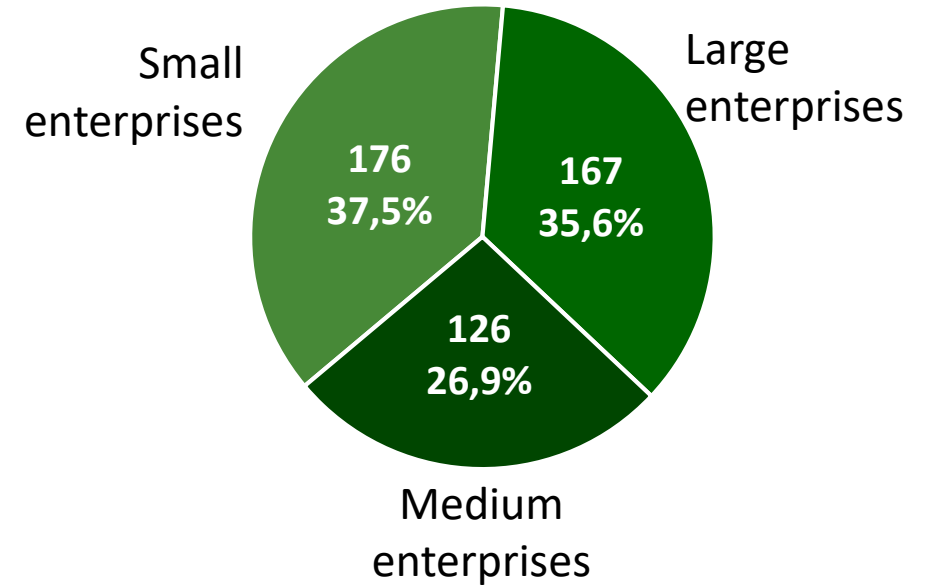

*The share of neutral (no change) answers are not presented

 Weights of sectors are determined by GVA, and used to construct consolidated index

METHODOLOGICAL COMMENT

- ✓ The information was prepared based on the results of monthly surveys of enterprises participating in the monitoring of the real sector.
- ✓ To calculate the Business Activity Index, the diffusion index (DI) is used, which is calculated as the sum of positive responses share and half of the unchanged responses share. This index is a generalized indicator characterizing the dynamics of changes in the indicator.
- ✓ The data on the diagram are presented with the elimination of the seasonality factor (except for future condition and factors).
- ✓ Changes are possible in the previous months dynamics due to seasonal clearing and GVA adjustment.
- ✓ The Business Climate Index and Business Cycle Clock are constructed using the methodology of Ifo institute, Germany.
- ✓ In April 2022 mining industry was separated, hence the series were recalculated.
